

**Io-Shield**

**Io-Shield**

**The unique balance of strength and elasticity of a barrier product**

The technical superiority of Io-Shield comes from a combination of the balance between :

- The optimal barrier strength for teat protection at every milking plus the easy removal of the product prior to the next milking.
- Product barrier elasticity for better teat comfort.

# Io-Shield

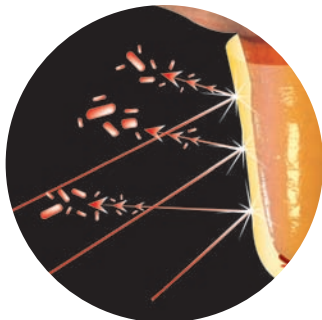

## Active Barrier for teat protection between milkings

### Why use **Io-Shield** ?

To efficiently protect and condition the teats in cases of difficult or specific environmental conditions.

### How to use **Io-Shield** ?

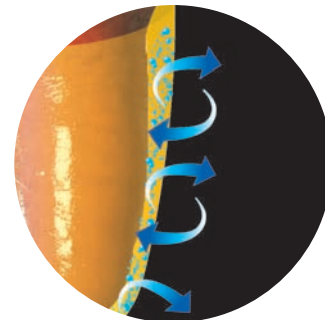

By dipping each animal, **after milking**. Only use as a post dip preparation.

**Io-Shield** forms an efficient and active polymerising barrier against physical and microbial challenges.

Double protection of the teat canal thanks to the barrier technology (balance between the resistance and the elasticity of the skin) and to the action of iodine (PVP).

The polymers in **Io-Shield** are especially selected to allow the teats to breathe, without blocking the metabolic exchanges.

The barrier remains on the teats between the milkings.

- The skin conditioning ingredients associated to the polymerizing complex in the product ensures perfect moisturizing of the skin.
- **Io-Shield** is easy to remove before the next milking using Ecolab foam technology or adapted cleaning methods.
- **Io-Shield** is a formulation that meets the needs of modern food safety requirements.

**Io-Shield** uses advanced barrier technology providing the balance between the necessary physical resistance of the barrier and the physiological needs of the teats.
